

Rikky Hidayad

Batam, Indonesia 2026

I am interested in the point where **technology**, **design**, and **human behaviour** meet. Whether I am building a **network security lab**, running a **small design business**, managing social media for local brands, or **imagining a fishing community platform**, I usually start the same way.

I find a problem that bothers me.

Then I keep working on it until I understand it.

My Journey over the last few years, I Have worked across different fields like Cybersecurity, Design, Branding Social Media, Small Business Operations, Product Ideas.

At first glance they seem unrelated.

To me, they are all the same thing to **Understanding People**, **Identifying Problems**, and **Creating systems that works better**

Project 01

Network Attack Simulation - Academic Lab

Group Project ARP Poisoning · DNS Spoofing · Man-in-the-Middle

Role : Project Manager & Lead Engineer

Overview

A multi-layer network attack simulation built to demonstrate how ARP Poisoning, DNS Spoofing, and Man-in-the-Middle interception can be chained together in a realistic internal network environment. The simulation also included a credential harvesting stage using a fake login page that mimicked a legitimate service.

My Contribution

- Designed the attack scenario and lab architecture.
- Built and configured the virtual environment (attacker, victim, and server machines).
- Troubleshoot network-layer issues during testing.
- Prepared technical documentation and presentation materials.

Key Challenge

When ARP Poisoning and DNS Spoofing were activated together, the network became unstable and requests frequently timed out. I identified IP forwarding configuration issues as the main cause and rebuilt parts of the setup to restore reliable traffic flow

What I Learned

This project showed me that effective attacks often result from several small weaknesses working together. Technical control over network traffic can create opportunities for further exploitation, which reinforced the importance of layered security and careful network configuration.

Setup Infrastruktur

Ubuntu Server

Legit Server

192.168.1.20

- Web legit
- PHP / HTML login page
- Localhost accessible di semua VM
- Target simulasi yang diakses korban

Kali Linux

Attacker Machine

192.168.1.10

- Web palsu
- Credential logger
- BetterCap: ARP + DNS spoofing
- IP Forwarding aktif (ip_forward = 1)

Kali Purple

Victim Machine

192.168.1.10

- Simulasi user / korban
- ARP table diverifikasi (arp -a)
- Traffic dialihkan via MITM
- Tidak sadar sedang diintercept

Dokumentasi Project

Project 02

Phishing Simulation - Human Error Factor - Academic Lab

Group Project Phishing Simulation & Session Management

Role : Project Manager & Initiator

Overview

A phishing simulation designed to explore how credential exposure can occur through a combination of human behaviour and session management weaknesses in web applications.

The project simulated a realistic phishing scenario using two visually similar web applications: one legitimate and one malicious. By leveraging visual similarity, subtle URL differences, and active session cookies, the simulation demonstrated how users could unknowingly disclose their credentials while continuing to interact with what appeared to be a trusted service.

My Contribution

- Initiated and proposed the project concept.
- Planned the phishing simulation workflow and attack scenario.
- Coordinated team responsibilities and project execution.
- Assisted in configuring the phishing and legitimate web environments.
- Prepared technical documentation and presentation materials.
- Lead project presentation and explained security findings.

Key Challenge

Creating a phishing environment that felt realistic without making the fake website obviously suspicious was the primary challenge. The team needed to replicate the appearance and behaviour of the legitimate application while ensuring the simulation clearly demonstrated how visual trust and active sessions could influence user decisions.

What I Learned

This project taught me that security vulnerabilities are not always caused by technical flaws alone. Human behaviour, trust, and familiarity with a website can significantly influence security outcomes. I also learned how session management mechanisms, while designed to improve user experience, can unintentionally reduce signs of compromise when not carefully considered from a security perspective.

Project 03

Social Media& Branding Indojastip Express - Entrepreneur

Indojastip Express & Jastip Segantang Lada

Business & Marketing Project

Overview

A branding and social media project focused on helping emerging logistics and personal shopping services establish trust in a highly competitive market. Through consistent visual communication, content planning, and customer engagement, the project supported the development of a recognizable brand presence across digital platforms.

My Contribution

- Developed content strategies and posting plans.
- Designed social media posts, promotional materials, and brand assets.
- Maintained visual consistency across marketing channels.
- Assisted in customer communication and engagement.
- Created content highlighting services, promotions, and customer experiences.
- Helped shape the overall brand identity and messaging.

Key Challenge

Building trust was the biggest challenge. Since customers often evaluate service reliability through social media before making inquiries, every piece of content needed to communicate professionalism, credibility, and consistency. Balancing promotional content with informative and engaging posts required continuous experimentation and refinement.

What I Learned

This project taught me that effective branding is not just about visual design. Trust is built through consistency, clear communication, and understanding customer expectations. I also gained experience in translating business goals into content strategies that help create stronger connections with audiences.

RD Kreasi - Design & Print Bussiness - Entrepreneur

Independent Design & Print Business

Founder & Designer

Overview

An independent design and **printing business** that I have managed for several years, providing creative solutions for **individuals, organizations, and local businesses**.

The business involved handling projects from initial client consultation to final production, requiring a **combination of design, communication, and project management** skills. Through this experience, I learned how to translate client needs into practical **visual solutions** while balancing **quality, deadlines, and customer expectations**.

My Contribution

- **Founded and managed** the business independently.
- Conducted **client consultations** and requirement gathering.
- Designed promotional materials, event merchandise, and **print products**.
- **Coordinated production** and delivery processes.
- Managed customer communication and **project timelines**.
- Ensured **quality control** throughout each project.

Key Challenge

One of the **biggest challenges** was transforming **abstract client ideas** into clear visual outcomes. Many clients knew what they wanted to achieve but struggled to **communicate it visually**, requiring **careful discussion, iteration, and problem-solving** to align expectations with the final design.

What I Learned

This experience taught me that design is **not only about aesthetics**. Successful design begins with **understanding people, identifying their needs, and communicating ideas effectively**. Managing a **small creative business** also strengthened my skills in client relations, project management, and **decision-making under real-world constraints**.

Looking Ahead Concept Project

FishLog - Mobile Application Concept

Fishing Logbook & Species Discovery Platform

The Problem

Anglers across Riau Islands carry years of knowledge about **spots, techniques, and water conditions** entirely in their heads. **No system collects** that knowledge in a structured way. **Beginners don't know where to start.** **Experienced anglers have no way to pass down what they know.**

There is **no single database** that records: what fish, where, with what gear, under what conditions.

Positioning — What is FishLog?

App	Analogy	Focus
Anglr	Instagram for anglers	Social feed, catch photos, content sharing
Fishbrain	Strava for anglers	Personal tracking, statistics, social community
Fishlog	iNaturalist for anglers	Verified data, community index, local knowledge legacy

Anglr and Fishbrain compete on social engagement. **FishLog plays a different game data** credibility and inherited knowledge. Not who gets the most likes, but who builds the **most complete index**.

Concept References

- **Pokemon GO**

The core idea is location-based collection. People travel because certain species can only be found in specific places. FishLog applies the same concept, where fishing spot data is built by users who physically visit locations and contribute to a shared index.

- **Fish It (Roblox)**

Fish species appear under specific conditions such as weather and time. Every catch contributes to a Fish Index that drives long-term engagement. FishLog brings this mechanic into the real world using actual catches and environmental conditions.

- **iNaturalist**

A citizen science platform that uses photos and GPS data as verifiable evidence. FishLog adopts this validation approach while adding social interaction and gamification tailored for anglers.

- **Strava**

Transforms personal activity records into achievements through leaderboards and community engagement. FishLog applies the same principle to fishing, where each catch contributes to a personal and verifiable fishing history.

Looking Ahead Concept Project

FishLog - Mobile Application Concept

Fishing Logbook & Species Discovery Platform

The Solution

FishLog turns every angler into a **data contributor**. Every logged catch builds a living **community index**. Specific **by region, verified through photo metadata**, enriched by real-time conditions.

Target Users

- Experienced Anglers

Motivated by legacy. They carry decades of knowledge that exists only in their heads. FishLog gives them a reason to **document it their name recorded permanently** as the first to **discover a species or spot**.

- Beginner Anglers

motivated by orientation. They do not know which spot, **which bait, what time**.

FishLog gives them **access** to structured community knowledge that cannot be faked.

Concept References

- **Photo-based Catch Logging**

Photo is the primary evidence. EXIF metadata automatically locks GPS coordinates and timestamp the moment the photo is taken — cannot be changed after submission. A photo taken at home means home coordinates. The system cannot be deceived.

- **Auto-fetch Real-time Conditions**

Weather, wind, and tidal conditions are automatically pulled from APIs based on coordinates and time of logging. Locked together with the entry — not filled manually, not manipulable.

- **Regional Index**

Hierarchy of Kepri - Area - Species. Nongsa, Galang, Belakang Padang each have their own index. Every species page shows all documented catches, most commonly used gear, and conditions when the catch was successful.

- **Honor Title System**

first to log a species in an area, name recorded permanently on that species index page. or first to log from a new spot coordinate, name recorded permanently on that spot page. One mechanism, two contexts neither can be taken away.

- **Personal Index**

Every angler's personal index total species caught, total spots documented, titles earned, full catch history. Cannot be faked because every entry is bound to locked data.

Data Integrity — By Design, Not Policy

- **Cannot be manipulated** : Coordinate & timestamp from photo EXIF, Weather & tide from API, locked at time of log
- **User Input** : Species, Weight estimate, Gear Used
- **Social Validation** : Community Confirmation at "Phase 2"

Looking Ahead Concept Project

FishLog - Mobile Application Concept

Fishing Logbook & Species Discovery Platform

Phase 2

Community confirmation on **catch entries**, aggregated gear recommendations per spot and species, full spot pages, and **offline sync for waters without signal timestamp** and coordinates remain from the original photo, **weather fetched via historical API**.

Why Kepri

Hundreds of islands, **dramatically varied spot characteristics across** Nongsa, Galang, Belakang Padang, and surrounding waters, **active fishing community** but zero **structured documentation** of local knowledge. Kepri is not a limitation. It is the ideal condition to prove this concept works.

If proven in Kepri, the same pattern scales to **every fishing water across Indonesia**.

Core Loop

Log catch → Enter Regional Index → Earn Title → Personal Index grows → Flex → Repeat
